

FreshLink AI — Complete Product Requirements & ZET AI Implementation Prompt

1. PROJECT INSTRUCTION

Build a complete, modern, responsive and functional web application called **FreshLink AI**.

FreshLink AI is an **AI-powered agricultural platform connecting farmers and buyers**, combining:

- * AI demand prediction
- * Farmer-to-buyer product discovery
- * AI-assisted price negotiation
- * Time-aware selling recommendations
- * Spoilage prediction
- * Weather-based farming recommendations
- * AI product quality checking
- * Buyer recommendations
- * Pre-booking and ordering
- * Payment details
- * Refund handling
- * Delivery tracking
- * Customer feedback
- * Farmer reliability scoring
- * Unsold-stock alerts
- * Discount offers
- * AI chatbot negotiation

This must feel like a **real production-style application**, not a basic prototype.

Critical instruction

Do NOT remove or simplify the existing FreshLink AI PRD functionality.

The original FreshLink AI negotiation workflow must remain the core feature:

Farmer creates listing

- Buyer views listing
- Buyer makes opening offer
- FreshLink AI analyses negotiation
- AI generates converging price range
- AI explains recommendation
- Farmer accepts or counters
- Buyer accepts or counters
- Agreement reached
- Payment/order confirmation
- Negotiation logged

The farmer's private minimum/floor price must NEVER be exposed directly to the buyer.

If an advanced AI/API is unavailable, implement a working explainable fallback using seeded/demo data and deterministic rule-based logic. Do not leave empty buttons or fake non-functional screens.

2. BRAND IDENTITY

Product Name

****FreshLink AI****

Tagline

****Sell It Before It Spoils.****

Use this tagline prominently under the FreshLink logo.

The brand should communicate:

- * Fresh produce
- * Smart decisions
- * AI
- * Sustainability
- * Trust
- * Fair pricing
- * Reduced food waste

Logo

Use:

****Green leaf icon + FreshLink****

The word ****FreshLink**** should use a modern, premium, highly readable font.

3. OVERALL UI / UX DESIGN

The design must be visually close to the provided FreshLink reference image.

Visual style

Use:

- * Agricultural green as primary color
- * Deep green for important buttons/text
- * White cards
- * Very light green backgrounds
- * Soft gray
- * Subtle yellow/orange accents
- * Green gradients
- * Green glassmorphism where appropriate
- * Rounded cards
- * Soft shadows
- * Clean modern typography
- * Simple line icons
- * Agricultural illustrations/images
- * Clear hierarchy
- * Consistent spacing
- * Responsive layouts

Important

The application must NOT look like a plain/basic generated dashboard.

It should feel like a polished SaaS/product application suitable for:

- * Hackathon demo
- * Farmer demonstration
- * Buyer demonstration
- * Investor presentation
- * Real-world product prototype

Use meaningful empty states, loading states, success states, error states and confirmation dialogs.

All buttons must perform an action or navigate to a working screen.

4. USER ROLES

The application must support:

1. Farmer
2. Buyer / Consumer

The user must select their role during signup/login.

5. WELCOME / ONBOARDING SCREEN

Create a premium mobile-style onboarding page.

Top

FreshLink logo

Top-right:

Skip →

Main headline

Sell It Before It Spoils.

Secondary headline:

Better Decisions. Less Waste. A Fresher Tomorrow.

Description:

AI-powered agricultural intelligence connecting farmers and buyers.

Feature highlights

Show three visual features:

- * Predict Demand
- * Sell at the Right Time
- * Reduce Food Waste

Background

Use a beautiful agricultural field/farmer visual with a green overlay.

Buttons

Primary:

****Get Started****

Secondary:

****I already have an account****

Footer:

****Fresh Produce • Stronger Farmers • Healthier Communities****

6. AUTHENTICATION

The authentication experience must be different for:

* Sign Up

* Login

Use a green gradient / green glassmorphic background.

FreshLink logo and title should be highly highlighted.

Under the product name show:

****Sell It Before It Spoils.****

7. SIGN UP SCREEN

After selecting Farmer or Buyer, show the required registration form.

Role selector

* Farmer

* Buyer

Selected role should be highlighted in green.

Farmer / Buyer registration fields

Ask for:

- * Full Name
- * Age
- * Username
- * Phone Number
- * Email ID
- * Password
- * Confirm Password
- * ID Proof
- * Location
- * Language

Default language:

****English****

Allow location access through the browser/device location permission.

If location permission is denied, allow manual location selection.

CAPTCHA

Include CAPTCHA / human verification before signup submission.

ID Proof

Allow ID proof upload.

Display:

* Upload ID

* File name

* Upload status

Do not expose private ID information to other users.

Signup action

Green:

****Create Account****

Google

Divider:

****or****

Button:

****Continue with Google****

Existing account

****Already have an account? Sign In****

8. LOGIN SCREEN

Login must contain:

* Farmer / Buyer role selector

* Username

* Password

* CAPTCHA

* Remember Me checkbox

* Password visibility icon

Primary button:

****Sign In****

Below:

****Forgot Password?****

Divider:

****or****

Button:

****Continue with Google****

Bottom:

****Don't have an account? Sign Up****

9. FARMER DASHBOARD

After successful farmer login, show the farmer's name prominently.

Example:

****Good morning, Ravi! 🙌****

Subtitle:

****Here's what's happening with your farm and produce today.****

Top bar

Include:

- * Search
- * Notifications
- * Farmer profile
- * Location
- * Language selector

* Settings

10. FARMER SIDEBAR

Navigation:

* Home

* My Crops

* Demand Forecast

* AI Selling Advisor

* My Orders

* Negotiations

* Buyers

* Discounts & Offers

* Quality Check

* Weather & Farming

* Unsold Stock

* Messages

* Payments

* Feedback & Reliability

* Settings

11. FARMER DASHBOARD SUMMARY CARDS

Create three prominent white cards arranged vertically/horizontally depending on screen size.

Card 1

****Active Crops****

Example:

****3****

Card 2

****Pre-booked Orders****

Example:

****8****

Card 3

****Expected Revenue****

Example:

****₹12,450****

Use realistic demo values.

Do not hard-code the same values permanently. Connect them to application data where possible.

12. FARMER RELIABILITY SCORE

Create a prominent circular chart.

Example:

****92%****

Label:

****Farmer Reliability Score****

Breakdown:

- * Product Quality
- * On-time delivery
- * Customer feedback
- * Order completion
- * Cancellation rate

Show:

****Based on customer feedback and completed transactions****

The score must update when new feedback is submitted.

13. CUSTOMER FEEDBACK SYSTEM

After an order is completed, the buyer/consumer can submit:

- * Overall rating
- * Product quality rating
- * Freshness rating
- * Packaging rating
- * Delivery rating
- * Written feedback

Example:

****Fresh and good quality tomatoes.****

Store the feedback.

Use feedback data to calculate the farmer's reliability score.

Display recent feedback on the farmer dashboard.

14. AI DEMAND FORECAST

Create a large dashboard section:

AI Demand Forecast

Show:

- * Crop selector
- * Predicted demand
- * Historical demand
- * Current supply
- * Planned supply
- * Demand trend
- * Percentage change

Example:

****Tomato****

****480 kg predicted demand****

****↑ 20% higher than usual****

Use a chart comparing:

- * Historical demand
- * AI predicted demand
- * Farmer planned supply

The system should use available historical/demo data.

Do not falsely claim live AI if real data/API is unavailable.

15. AI DEMAND PREDICTION ENGINE

The demand prediction engine should consider available data such as:

- * Historical demand
- * Previous sales
- * Crop
- * Region
- * Season
- * Weather
- * Day/time
- * Previous orders
- * Buyer demand
- * Supply availability

If historical ML data is insufficient, use an explainable fallback.

The UI should clearly show why the prediction was generated.

16. TIME-BASED SELLING PREDICTION

Add an AI feature:

Best Time to Sell

Show:

* Today

* Tomorrow

* Next 2 days

* Next 7 days

Example:

****Best selling window: Tomorrow evening****

Reason:

****Demand is expected to increase while freshness remains high.****

The recommendation should account for:

* Harvest date

- * Shelf-life
- * Demand
- * Current supply
- * Expected demand
- * Urgency

17. SPOILAGE PREDICTION

Create:

AI Spoilage Risk

Show a visual indicator:

- * Low
- * Medium
- * High
- * Critical

Example:

****Spoilage Risk: Medium — 48%****

Show remaining estimated freshness.

Example:

****Approximately 22 hours of recommended selling time remaining.****

Provide an explanation.

18. WEATHER & FARMING AI ADVISOR

Create a dedicated section:

AI Farming Advisor

Show weather forecast and farming recommendations.

The AI should provide recommendations related to:

- * Growing
- * Harvesting
- * Selling
- * Rain
- * Temperature
- * Humidity
- * Crop suitability

Example:

****Tomato****

****Recommended climate: Warm conditions with controlled moisture****

Show:

- * Current weather
- * Upcoming weather
- * Rain prediction
- * Temperature
- * Humidity

Provide AI suggestions such as:

****Harvesting suggestion: Rain expected in the next 24 hours. Consider harvesting mature tomatoes earlier to reduce spoilage risk.****

Also show:

****Crop Climate Guide****

For each supported crop show suitable:

- * Temperature
- * Rainfall
- * Humidity
- * Growing conditions

For MVP, Tomato should remain the primary crop as specified in the original PRD.

19. CREATE FARMER LISTING

Create a professional multi-step listing form.

Step 1 — Crop Details

- * Crop
- * Quantity
- * Location

Step 2 — Harvest Information

- * Harvest date
- * Shelf-life
- * Expected availability

Step 3 — Price

- * Expected price
- * Private minimum/floor price

The floor price must be stored securely and never shown to buyers.

Step 4 — Quality

- * Product quality details
- * Packaging details
- * Optional product images
- * Packing video

Step 5 — Review

Show all information before publishing.

Button:

****Publish Listing****

20. FARMER PACKING VIDEO + AI QUALITY CHECK

Create a dedicated:

AI Quality Check

The farmer can:

- * Upload packing video
- * Upload product photos
- * Open camera
- * Capture live product images/video

The ****Open Camera**** button must request browser/device camera permission and open the real camera when supported.

Do not create a fake camera screen.

After upload/capture:

Run an AI-style quality analysis.

Show:

- * Freshness estimate
- * Visible damage indicator
- * Packaging quality
- * Product appearance
- * Potential spoilage indicators
- * Quality score

Example:

****AI Quality Score: 89/100****

Provide understandable reasons.

If real computer vision is unavailable, implement a clearly labelled demo/simulated quality-analysis pipeline rather than claiming unsupported real-world detection.

21. FARMER DISCOUNT & OFFER DASHBOARD

Create:

Discounts & Offers

Farmers can create:

- * Percentage discount
- * Fixed price discount
- * Bulk purchase discount
- * Limited-time offer

Example:

****Tomato — 10% off for orders above 50 kg****

Show:

- * Offer duration
- * Minimum quantity
- * Discount
- * Eligible buyers

Allow farmers to edit/deactivate offers.

22. BUYER DASHBOARD

Create a separate buyer experience.

Buyer dashboard should have:

Header

- * FreshLink logo
- * Search bar
- * Notifications
- * Buyer profile
- * Location

Greeting:

****Hello, Sneha! 🙌****

Subtitle:

****Find fresh, local produce from nearby farmers.****

23. GLOBAL SEARCH

Add a prominent search bar.

The buyer should be able to search:

- * Farmer names

- * Products

- * Crops

- * Items

- * Locations

Examples:

****Search farmers, products or crops...**b>**

Search results should display relevant farmers/products.

24. NEARBY FARMERS

Create:

Nearby Farmers

Display farmers based on location.

Each farmer card should show:

- * Farmer name

- * Profile photo

- * Location
- * Distance
- * Reliability score
- * Customer rating
- * Available crops
- * Price range

Button:

****View Profile****

25. FARMER PROFILE PREVIEW

Create a farmer profile page.

Show:

- * Farmer name
- * Profile image
- * Location
- * Reliability score
- * Circular reliability chart
- * Customer reviews
- * Crops available
- * Product quality score
- * Successful orders

* Response rate

Also show the farmer location on an interactive map.

Do not expose unnecessary private information.

26. BUYER PRODUCT DISCOVERY

Create:

Nearby Available Produce

Category filters:

* All

* Vegetables

* Fruits

* Greens

Product cards show:

* Product image

* Product name

* Farmer

* Price/kg

* Quantity

- * Location
- * Distance
- * Freshness
- * Spoilage risk
- * Reliability score

Buttons:

****View Details****

****Pre-book****

****Make Offer****

27. BUYER PRODUCT DETAILS

Show:

- * Product
- * Farmer
- * Quantity
- * Price
- * Harvest date
- * Freshness
- * Estimated shelf-life
- * Quality score

* Farmer reliability

* Location

* Available discounts

Actions:

****Make Offer****

****Pre-book****

28. AI PRICE NEGOTIATION

This is one of the CORE FreshLink AI features.

Buyer enters an opening offer.

Example:

Farmer private floor price:

₹22/kg

Buyer offer:

₹18/kg

The buyer must NOT see the farmer's ₹22 floor price.

FreshLink AI analyses:

- * Farmer floor price
- * Buyer offer
- * Local market/mandi average
- * Time since harvest
- * Shelf-life
- * Urgency
- * Historical negotiation data when available

Then generate:

****Suggested Price Range: ₹20–₹22/kg****

Also show:

****Why this recommendation?****

Example:

****Freshness urgency is increasing, so reaching an agreement sooner can help protect produce value.****

Add a conversational AI negotiation interface.

The farmer and buyer should be able to negotiate through a chatbot-style interface.

Example:

Buyer:

****I can offer ₹18/kg.****

AI:

****Based on the current market range and freshness, a reasonable range is ₹20–₹22/kg.****

Farmer:

****I can do ₹21/kg.****

AI:

****₹21/kg is within the current suggested range. Would you like to send this counter-offer?****

Buyer:

****Yes, I accept ₹21/kg.****

The AI must assist but must NEVER make the final decision automatically.

Both parties retain control.

30. ACCEPT / COUNTER

Farmer can:

- * Accept
- * Counter
- * Reject

Buyer can:

- * Accept
- * Counter
- * Withdraw

Every negotiation action should be logged.

Store:

- * Initial offer
- * AI suggested range
- * Counters
- * Final price

* Time taken

* Outcome

31. TIME-AWARE NEGOTIATION

The suggested price range must change according to urgency.

Early after harvest:

****Higher suggested range****

As shelf-life decreases:

****Range gradually moves toward the buyer's offer****

This is a key FreshLink AI feature.

32. COLD-START FALLBACK

If historical negotiation data is unavailable, use a rule-based explainable fallback using:

* Farmer floor price

* Buyer offer

* Local mandi average

- * Market deviation
- * Time since harvest
- * Shelf-life
- * Urgency

The application must continue working even without historical ML data.

33. PAYMENT

Add payment details to both Farmer and Buyer experiences.

After an agreement is reached:

Show:

- * Product
- * Quantity
- * Agreed price/kg
- * Total amount
- * Buyer
- * Farmer
- * Order ID
- * Payment status
- * Payment method
- * Transaction status

Buyer side:

****Proceed to Payment****

Support demo payment methods such as:

* UPI

* Card

* Net Banking

For the hackathon, payment can use a simulated/demo payment flow if a real payment gateway is not configured.

Do not claim that real money is transferred unless a real payment gateway is integrated.

After successful payment:

****Payment Successful****

Generate transaction/reference ID.

Farmer dashboard should show:

****Payment Received / Payment Pending****

34. REFUND SYSTEM

Create:

Request Refund

Buyer can request a refund if:

- * Product is damaged
- * Product is rotten/spoiled
- * Wrong product received
- * Quantity mismatch
- * Serious quality issue

Buyer must be able to:

- * Select reason
- * Upload photos
- * Add description
- * Submit request

Show refund status:

- * Submitted
- * Under Review
- * Approved
- * Rejected
- * Refunded

If AI quality-check data exists, use it as supporting evidence.

35. ORDER CONFIRMATION

After both parties agree and payment/order flow is completed:

Show:

****Deal Confirmed****

Details:

* Crop

* Quantity

* Agreed price

* Total

* Farmer

* Buyer

* Pickup/delivery method

* Payment status

* Order status

Example:

****Tomato — 50 kg****

****₹22/kg****

****Total: ₹1,100****

36. DELIVERY PARTNER TRACKING — BUYER SIDE

Buyer should have:

Track Delivery

Show:

- * Delivery partner
- * Driver status
- * Current location
- * Pickup status
- * Estimated arrival
- * Delivery progress

Use an interactive map UI where supported.

Example status:

****Order Confirmed → Farmer Preparing → Picked Up → On the Way → Delivered****

If real GPS/delivery API is unavailable, use a clearly labelled demo tracking simulation.

37. BUYER UNSOLD-STOCK / NEED ALERT

Create a buyer-side feature:

What Do You Need?

The system should detect or allow buyers to specify expected requirements.

Example:

****You may need:****

* Tomato — 80 kg

* Onion — 50 kg

* Spinach — 30 kg

Show alerts based on:

* Previous orders

* Buyer demand

* Saved requirements

* Current stock

* Expected consumption

* Upcoming demand

Example:

****Tomato stock may run low in 2 days. Nearby farmers have 180 kg available.****

38. FARMER UNSOLD STOCK ALERT

Create:

Unsold Stock Alert

If a farmer has produce approaching its shelf-life and insufficient orders:

Show:

****⚠ Unsold Stock Risk****

Example:

****35 kg Tomato may remain unsold within the next 24 hours.****

AI recommendations:

- * Reduce price
- * Create discount
- * Contact recommended buyers
- * Increase visibility

* Sell immediately

39. AI BUYER RECOMMENDATION

Recommend buyers to farmers based on:

- * Location
- * Crop
- * Required quantity
- * Buyer demand
- * Previous transactions
- * Reliability
- * Current demand forecast

Show:

****Recommended Buyers****

Each card:

- * Buyer name
- * Type
- * Distance
- * Required quantity
- * Demand level
- * Reliability

* Pre-book / Contact

40. DEMAND + LOCATION INTELLIGENCE

Use location-aware recommendations where permission is provided.

Display:

- * Nearby farmers
- * Nearby buyers
- * Nearby demand
- * Distance
- * Region
- * Map

Location access must always respect browser/device permissions.

41. NOTIFICATIONS

Create notification center for both roles.

Examples:

Farmer:

- * New buyer offer
- * AI price recommendation
- * Unsold stock alert
- * Weather alert
- * Quality check completed
- * Payment received
- * New customer feedback
- * New discount opportunity

Buyer:

- * Offer accepted
- * Counter-offer received
- * New nearby produce
- * Delivery update
- * Refund update
- * Stock alert
- * Recommended farmers

42. MESSAGES

Create a messaging interface.

Farmer and buyer can communicate about orders/negotiations.

Include:

- * Text messages
- * Negotiation messages
- * Order references
- * AI assistant suggestions

43. ORDER HISTORY

Both Farmer and Buyer should have:

My Orders

Show:

- * Active orders
- * Completed orders
- * Cancelled orders
- * Refunds
- * Payment status
- * Delivery status

44. FARMER ORDER DASHBOARD

Farmer should see:

- * Incoming orders
- * Active orders
- * Completed orders
- * Revenue
- * Payment status
- * Buyer feedback
- * Reliability impact

45. BUYER ORDER DASHBOARD

Buyer should see:

- * Current orders
- * Past orders
- * Payment history
- * Delivery tracking
- * Refund requests
- * Feedback submitted

46. AI EXPLANABILITY

Every AI recommendation must include a short explanation.

Examples:

Demand

Demand is expected to increase because historical demand is higher during this period and current weather conditions may increase local purchases.

Selling time

Selling within the next 24 hours is recommended because freshness is decreasing while buyer demand remains high.

Price

The suggested range balances the buyer offer, market price and remaining shelf-life.

Spoilage

Spoilage risk increased because the produce is approaching its estimated shelf-life.

Never show unexplained AI scores.

47. AI / ML ARCHITECTURE

Use the original proposed technology stack where practical:

Frontend:

- * React-based responsive interface

Backend:

- * Python
- * FastAPI

ML:

- * Python
- * pandas
- * scikit-learn
- * XGBoost where appropriate

Database:

- * PostgreSQL

Real-time:

- * Redis where practical

External data:

- * Agmarknet / mandi data when available
- * Weather API when available

Deployment:

- * Docker-ready

Version control:

- * GitHub-ready

If external APIs are unavailable, create a clean service abstraction and seeded demo data so the application remains fully demonstrable.

48. DATABASE

Maintain data structures for:

Users

- * user_id

- * name

- * age

- * username

- * phone

- * email

- * role

- * location

- * language
- * id_proof_reference
- * created_at

Listings

- * listing_id
- * farmer_id
- * crop
- * quantity
- * harvest_date
- * shelf_life
- * floor_price
- * region
- * quality_score
- * spoilage_risk
- * status
- * created_at

Offers

- * offer_id
- * listing_id
- * buyer_id
- * offer_price
- * timestamp
- * status

Negotiations

- * negotiation_id
- * listing_id
- * buyer_id
- * farmer_id
- * ai_suggested_min
- * ai_suggested_max
- * final_price
- * status
- * created_at
- * completed_at

Orders

- * order_id
- * listing_id
- * buyer_id
- * farmer_id
- * agreed_price
- * quantity
- * total_amount
- * status
- * created_at

Payments

- * payment_id

- * order_id
- * amount
- * payment_method
- * payment_status
- * transaction_reference
- * created_at

Feedback

- * feedback_id
- * order_id
- * buyer_id
- * farmer_id
- * rating
- * quality_rating
- * freshness_rating
- * packaging_rating
- * delivery_rating
- * comment
- * created_at

Refunds

- * refund_id
- * order_id
- * buyer_id
- * reason
- * evidence

- * status
- * amount
- * created_at

Delivery

- * delivery_id
- * order_id
- * partner
- * status
- * location
- * estimated_arrival

49. SECURITY & PRIVACY

Critical requirements:

Farmer floor price

NEVER expose it to buyer.

ID proof

NEVER expose it publicly.

Payment details

Protect sensitive information.

User data

Only show information appropriate to the current user role.

AI

AI must assist users, not make irreversible decisions without user approval.

50. CORE API REQUIREMENTS

Maintain the original APIs:

POST /auth/signup

POST /auth/login

POST /listings

GET /listings

GET /listings/{id}

POST /offers

GET /offers/{listing_id}

POST /negotiate

POST /negotiation/{id}/counter

POST /negotiation/{id}/accept

POST /orders

GET /orders

Add appropriate APIs for:

- * Payments
- * Refunds
- * Feedback
- * Reliability score
- * Quality check
- * Weather
- * Demand prediction
- * Spoilage prediction
- * Discounts
- * Buyer recommendations
- * Delivery tracking
- * Notifications
- * Messages

51. RESPONSIVE DESIGN

The app must work properly on:

- * Desktop
- * Laptop
- * Tablet
- * Mobile

Farmer dashboard can use desktop sidebar on large screens and mobile navigation on small screens.

Buyer experience should be especially mobile-friendly.

52. DEMO DATA

Seed realistic demo data.

Use:

Farmer

Ravi Kumar

Buyer

Sneha

Main crop

Tomato

Example listing

50 kg Tomato

Example farmer floor price

₹22/kg

Example buyer opening offer

₹18/kg

Example AI range

₹20–₹22/kg

Example final deal

₹21/kg

Do not expose the ₹22 farmer floor price to the buyer UI.

Create multiple farmers, buyers, products, orders, feedback and demand records for dashboard demonstrations.

53. COMPLETE DEMO FLOW

The final application must allow this complete demo:

Farmer

1. Signup/login
2. Open dashboard
3. Create tomato listing
4. Enter quantity
5. Enter harvest date
6. Enter shelf-life
7. Enter private floor price
8. Upload product/packing media
9. Run AI quality check
10. View demand prediction
11. View weather recommendation
12. View best selling time
13. View spoilage prediction
14. Publish listing

Buyer

15. Login
16. Search for tomato
17. Search farmer/product
18. View nearby farmers
19. View farmer reliability score
20. View product
21. View freshness/quality
22. Make opening offer

AI

23. Analyse negotiation
24. Generate suggested price range
25. Explain recommendation
26. Show urgency
27. Open AI negotiation chatbot

Negotiation

28. Farmer receives offer
29. Farmer counters
30. AI explains new range
31. Buyer counters/accepts
32. Agreement reached

Payment

33. Buyer proceeds to payment

34. Payment status updates

35. Farmer sees payment status

Order

36. Order confirmed

37. Delivery created

38. Buyer tracks delivery

Completion

39. Buyer receives product

40. Buyer submits feedback

41. Farmer reliability score updates

42. Transaction is logged

Additional scenario

43. Demonstrate unsold stock alert

44. Demonstrate discount creation

45. Demonstrate spoilage alert

46. Demonstrate refund request

47. Demonstrate refund status

54. IMPORTANT MVP PRIORITY

The original FreshLink AI hackathon MVP prioritizes a working negotiation flow rather than becoming a broad marketplace.

Therefore the implementation priority must be:

Priority 1 — MUST WORK

- * Authentication
- * Farmer listing
- * Buyer discovery
- * Buyer offer
- * AI price convergence
- * AI explanation
- * Time-aware urgency
- * Cold-start fallback
- * Accept/counter
- * Order confirmation
- * Negotiation logging
- * Payment demo
- * Feedback
- * Reliability score

Priority 2

- * Demand prediction

- * Selling-time recommendation
- * Spoilage prediction
- * Weather/farming advisor
- * Quality checking
- * Search
- * Nearby farmers
- * Map
- * Discounts
- * Unsold stock alerts

Priority 3

- * Delivery tracking
- * Advanced notifications
- * Advanced analytics
- * Additional AI enhancements

55. IMPORTANT OUT-OF-SCOPE PROTECTION

Do not turn this into an unnecessarily huge generic marketplace.

The FreshLink AI identity must remain centered around:

****AI + demand + freshness + fair negotiation + reducing food waste.****

Do not remove the negotiation layer and replace it with a normal marketplace.

The AI must remain explainable and must support, not replace, farmer and buyer decisions.

56. FINAL QUALITY REQUIREMENT

Before declaring the application complete, verify:

- * No broken navigation
- * No dead buttons
- * No empty pages
- * No console-breaking errors
- * Forms validate correctly
- * Login/signup works
- * Farmer flow works
- * Buyer flow works
- * Negotiation works
- * Floor price remains private
- * AI recommendation appears
- * AI explanation appears
- * Counter-offer works
- * Accept works
- * Order confirmation works
- * Payment status works
- * Feedback works
- * Reliability score updates

- * Refund flow works
- * Camera permission flow works
- * File/video upload works
- * Dashboard data updates
- * Responsive layout works

Use polished loading, success, warning and error states.

The final result should look and behave like a ****real FreshLink AI product****, not a collection of static mockup screens.

FINAL PRODUCT GOAL

FreshLink AI should help farmers and buyers make better decisions before perishable produce loses value.

The core experience should communicate:

****Predict demand → Understand freshness → Find the right buyer → Negotiate fairly with AI → Sell at the right time → Complete payment/order → Track delivery → Collect feedback → Improve farmer reliability****

Build the application end-to-end according to this specification.
